

## 6-2 Essential Steps To Prepare A Node-Express Project For Deployment

<https://web.programming-hero.com/l2-b1-b2-mission-success/video/l2-b1-b2-mission-success-10-2-essential-steps-to-prepare-a-node-express-project-for-deployment>

Can use this project for demo deployment :

[https://github.com/antik1801/FIRST\\_PROJECT\\_BY\\_ANTIK](https://github.com/antik1801/FIRST_PROJECT_BY_ANTIK)

Step 1: make server.ts and app.ts outside app folder into src →

First mistake: Many of us have done a terrible mistake that we place app.ts and server.ts inside /src/app folder

Step 2: Check lint

We have already installed eslint package

“lint” : “npx eslint .”  
– fix the issue

Step 3: Build the project →  
npm run build

## Deploy Express Application Into Vercel Using CLI And GitHub

<https://web.programming-hero.com/l2-b1-b2-mission-success/video/l2-b1-b2-mission-success-10-3-deploy-express-application-into-vercel-using-cli-and-github>

It may be possible that eslint didn't detect some of the errors , in that case we have to build the project and see the rest of the error that eslint didn't detect.

If no error occurred our project is ready to deploy.

There are so many popular platforms to deploy :

### **Vercel :**

- Vercel cli
- Github connect

### **Vercel CLI**

Step 1 : create a vercel.json file in root where package.json exists.

Step 2:

vercel.json →

```
{
  "version": 2,
  "builds": [
    {
      "src": "dist/server.js",
      "use": "@vercel/node"
    }
  ],
  "routes": [
    {
      "src": "/*",
      "dest": "dist/server.js"
    }
  ]
}
```

### **Vercel cli**

We have to install vercel cli

Step 1:

`npm i -g vercel`

Check command `vercel -v`

Step 2:

`vercel login`

> login with github

Step 3:

`vercel --prod`

>setup and deploy ? - y

>which scope you want to deploy? antik1801

>link to existing project : no

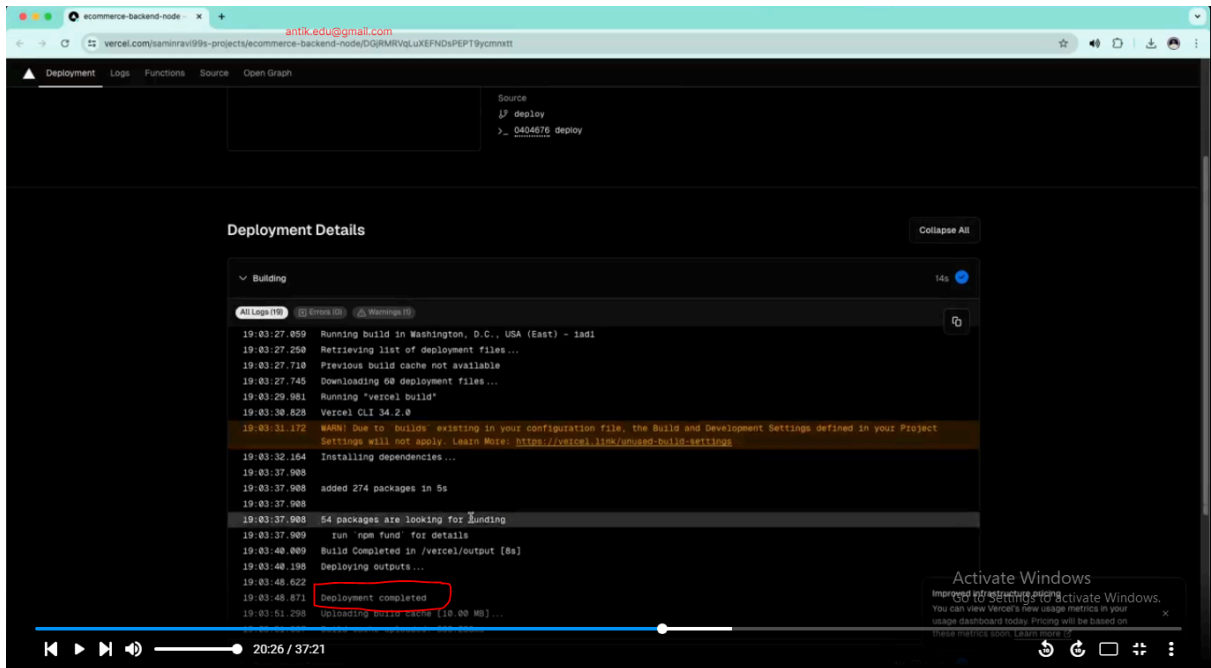

>name : any name

>witch location? : ./

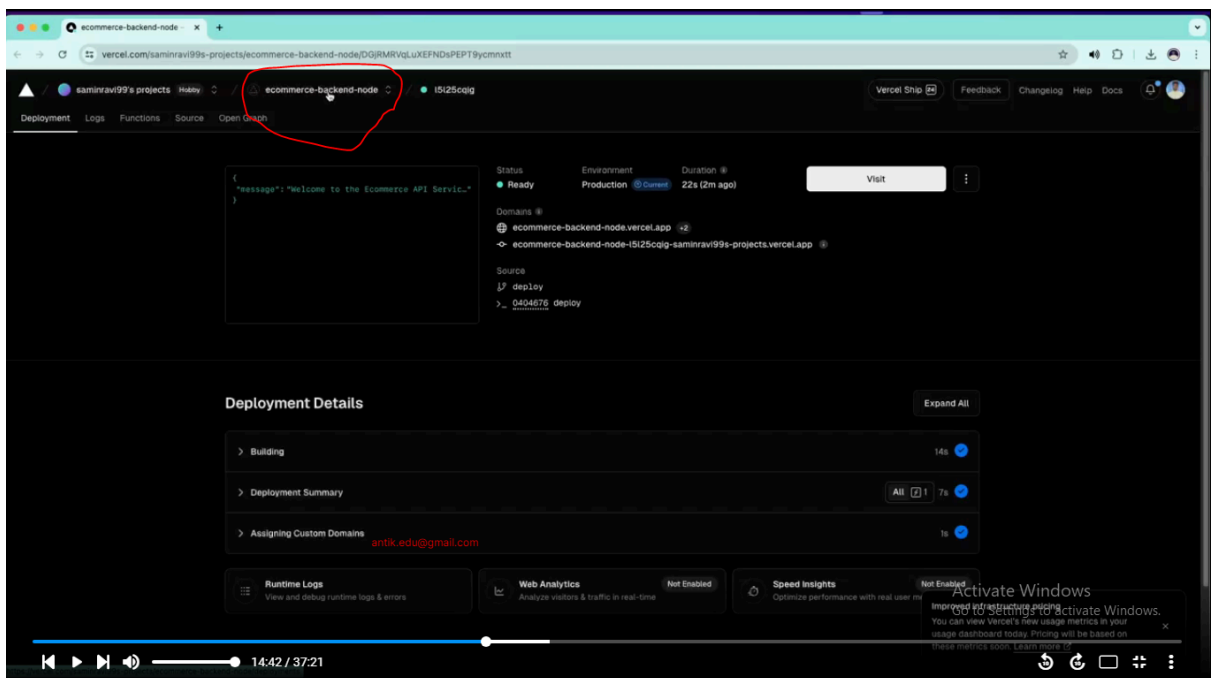

Step 4:

Open the link that is shown in inspect and click in the project name

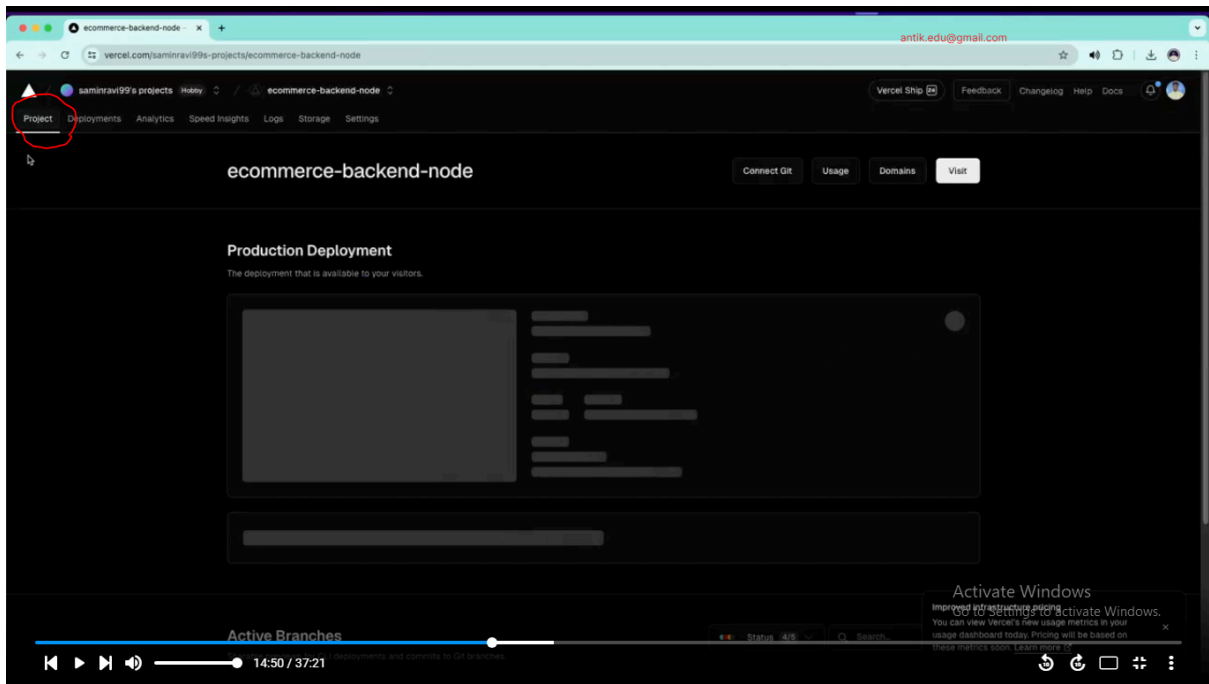

Access the buildin accordions

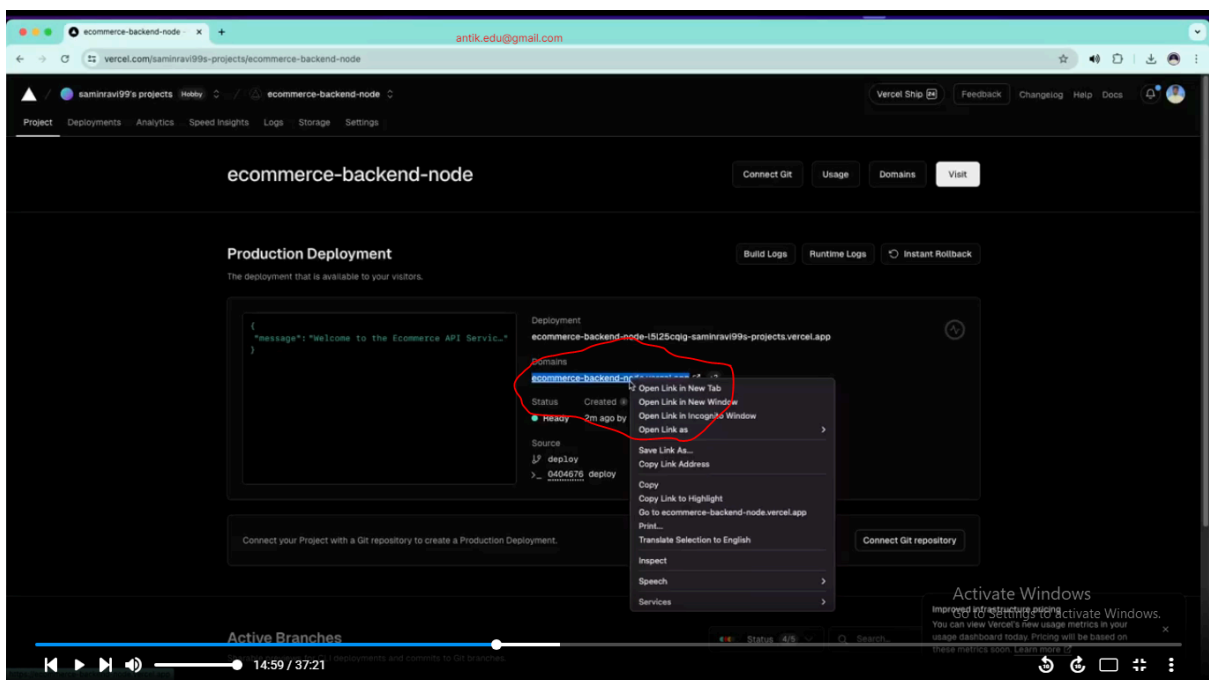

If deployment successful .

Now click on project

Now copy the link after the domains :

Now the production link is not ready to open from external resources.

## **Deploy with vercel cli**

Same as github

Step 1:

```
npm i -g vercel
```

Check command vercel -v

Step 2:

```
vercel login
```

```
> login with github
```

Step 3:

```
vercel --prod
```

```
>setup and deploy ? - y
```

```
>which scope you want to deploy? antik1801
```

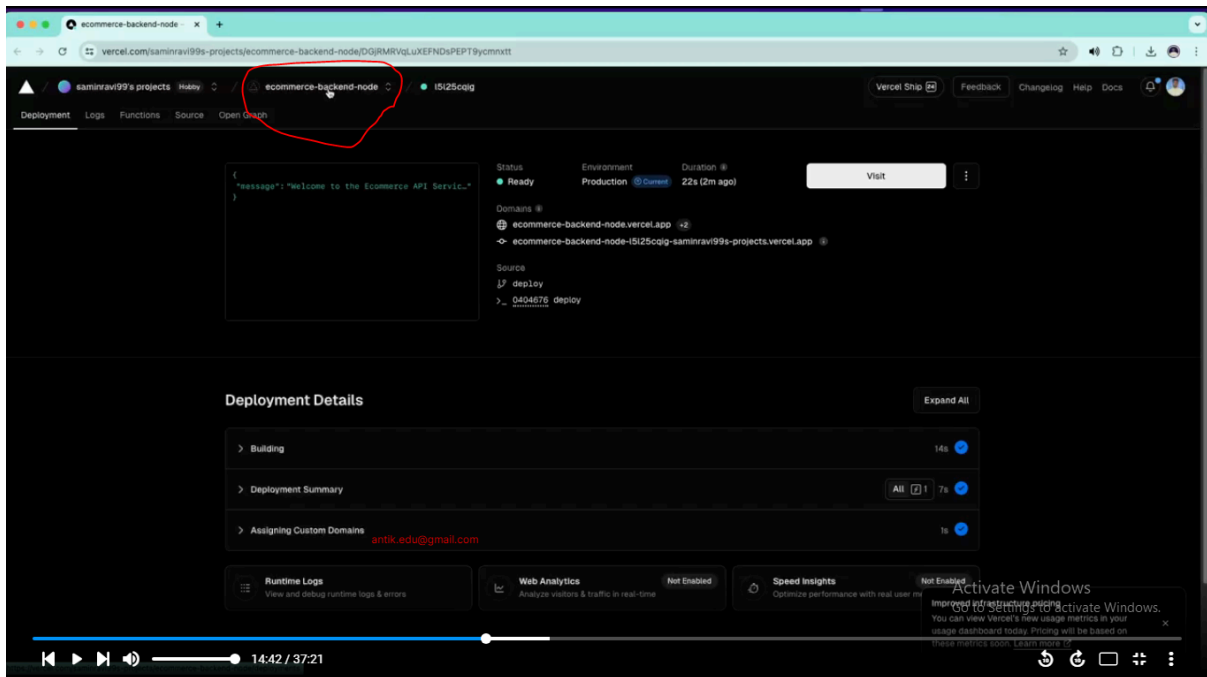

```
>link to existing project : no
```

```
>name : any name
```

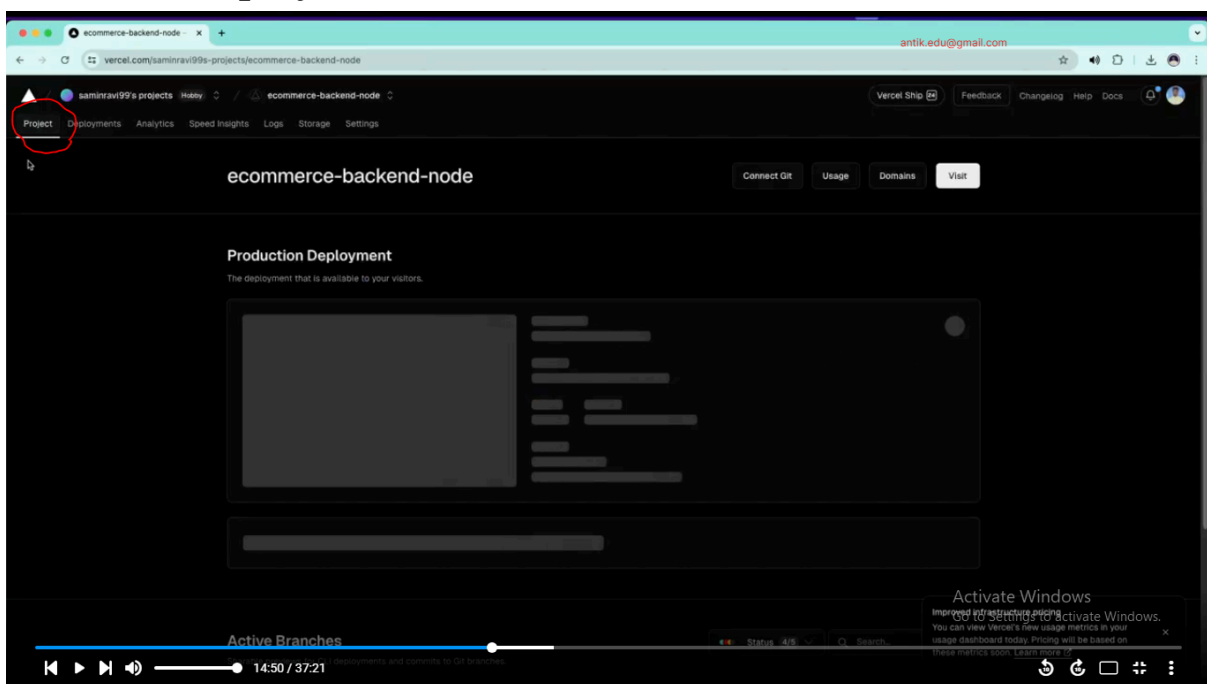

```
>witch location? : ./
```

Step 4:

Open the link that is shown in inspect and click in the project name

Now click on project

If we want to deploy through github make sure the branch your terminal has become the default brunch.

If you want to deploy in another branch , go to settings and change the default brunch.
